

Queues Using Double-Linked Linear Lists

D1262092 陳彥勻

This is my first time working on a C++ assignment, and it's quite a unique experience. We're required to avoid using `printf` and instead utilize `cin` and `cout` for input and output, respectively. Additionally, we're not allowed to use `malloc()` for memory allocation but rather should utilize `new`. When it comes to deallocating memory, we must steer clear of `free()` and opt for `delete` instead. The code itself isn't overly complex, but adapting to the C++ syntax and practices feels unfamiliar. I've reached out to friends for assistance, which has been invaluable.
